## **Top 10 Tips...**

## For Wasp Centrol

Are you sure you have wasps rather than bees? There are strict codes of practice and restrictions on the treatment of bees because they are endangered. Incorrect treatment could lead to prosecution.

If you have a swarm, it is likely to be honey bees, and will usually move on in a couple of days. If you have a persistent swarm, you will need a reputable beekeeper or professional pest control company like Monitor to assess removal.

Get the problem treated sooner rather than later - a small nest with a few wasps is easier to deal with than a large nest which could contain thousands of wasps. Do not try to knock down a fully built nest - it could contain over 20,000 wasps!

**Don't disturb a nest** - wasps will fiercely defend it.

**Control your waste** - rubbish bins should be fitted with close fitting or spring-loaded lids. Rubbish should be frequently disposed of and regularly cleaned of food wastes.

**Control your product** - ensure food products and ingredients are well contained, and clear spillages as soon as possible to avoid attracting wasps. They are particularly attracted to sweet substances in late summer.

6

**Exclude wasps from buildings** - foraging wasps can be excluded from buildings by the use of 3mm screens at windows and doors.

**Maintain your property** - Repair windows, door frames and broken/missing brickwork and fill holes with mortar or caulk.

Use wasp traps during the 'sweet feeding' stage - from late July onwards, wasps change from feeding on insects to foraging for sweet foods This is when they are more likely to sting. This can be managed with a planned wasp trap programme for outside areas, to intercept wasps vigorously pursuing scent trails for sweet foods.

Wasp nests won't be re-inhabited once treated, a nest in a loft-space is harmless and doesn't require removal. However, a spent nest in a food premises could be a source of contamination, so is best removed after treatment.
